Alerting Abstract WO A1

NOVELTY - A network communicates the user interactive **devices** to the **transaction** execution system. An application mechanism is coupled to the network for interfacing between the user interactive **devices** and the **transaction** execution system, and coordinating interaction of the user **interface devices** with the **transaction** execution system.

DESCRIPTION - INDEPENDENT CLAIMS are included for; a system for interfacing user interactive **devices** with a **transaction** execution system; a method for executing **transactions** requested by users using user interactive devices; a method for providing a **transaction** execution with the functionality of interacting with user interactive devices; an enterprise system for interfacing between a network and an existing user; a method for distributing scene information between a client and an application server across a network; a method for programming an application for use in an IP network environment.

USE - Providing add-on **transaction** system that **interfaces** network of users with an existing on-line **transaction** execution system.

ADVANTAGE - Does not require significant modifications to the functionality and/or protocol of such **transaction** execution system.

DESCRIPTION OF DRAWINGS - The drawing is a schematic system block diagram illustrating the integration of the **transaction** system of the invention, with a **transaction** execution system in a network environment.

- 10 **Transaction** system
- 12 Network
- 14 **Transaction** execution system
- 16 Users

Detailed Description

Claims

Claim

... transceiver that identifies a class of persons (e.g., handicapped)
such that when a person **interfaces** with the **transaction processing**
system 26, an attendant will be alerted as to any special customer needs.
Yet another...

...personal services to the customer. A further embodiment includes a customer transceiver 50 that transmits **automatic teller machine (ATM)** card information to an **ATM**. Once the **ATM** receives the information, the customer is prompted to input his/her PIN and **transaction** information, allowing the **process** to continue as usual. Various active and customer transceivers (48 and 50, respectively) may be...associated with the entered number, and it must be accepted by the merchant. Otherwise, the **process** will terminate without authorizing the **transaction**. After the customer information has been entered, **processing** flows to step 1245 where the CPU 1120 next transmits the stored customer/transmitter ID...communicate with the pay per view system and purchase the movie directly through the television. **Printer** 1320 may be used to **print** a **receipt** for a customer upon completion of a **transaction**, and **display** 1340 may be used to communicate information to a customer (e.g., when to input...

...An alternate embodiment merchant transceiver includes a merchant transceiver built into or attachable to a **portable device** (e.g., Palm Pilot™, handheld computer, etc.) that enables the capture and transmission of a...

...The merchant transceiver includes a CPU 1300 with sufficient memory 1305 to capture and locally **process** a **transaction**. The merchant transceiver may or may not have wireless connectivity to the **transaction processing** system 26. Yet a further embodiment includes a merchant transceiver associated with a vending machine...

...the merchant transceiver without departing from the scope of this invention. In a preferred embodiment, **transaction processing** system 26 is owned and operated by a company separate from the entities that own merchant store 12 and payment processing system 16. In exchange for the service provided by **transaction processing** system 26, merchants are charged fees to **process** transceiver-based **transactions**. First, a **transaction** fee is charged for each **transaction processed** through **transaction processing** system 26. In addition, an advertising fee may be charged to cover brand communication. That is, customer transceiver 50 is supplied under a brand name owned by the owner of **transaction processing** system 26. This brand name is widely advertised to entice customers to patronize merchant stores 12 having the ability to **conduct transactions** using customer transceiver 50. Thus, the owner of **transaction processing** system 26 charges an advertising fee to participating merchant stores 12. Alternatively, the **transaction processing** system 26 may permit large corporations owning multiple retail outlets to market customer transceiver 50...

Alerting Abstract WO A2

NOVELTY - A computer processor (12) retrieves moving pictures experts group audio layer three (MP3) files from database of remote source in response to user selected input. The processor also downloads retrieved files through sound system (60). **Cash** is also **dispensed** in response to user selected input.

DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- 1.A method for downloading digital information files;
- 2.System with ATM

USE - For automated **transaction machine** with digital information files e.g. music files, MP3 files, video files downloading functionality installed in bars, stores, restaurants, gas stations etc. Also for **downloading software**, digital images, TV shows, magazines, newspapers, games, database, compilations, books, etc.

ADVANTAGE - Downloads digital information files in addition to banking transaction such as **cash dispensing**, accepting deposits without requiring the user to have a computer. Since the downloaded files can be neither copied nor distributed, S/W piracy is prevented, thereby the **ATM** performs additional income without increasing the expense of its maintenance.

DESCRIPTION OF DRAWINGS - The figure shows a system with an automated
transaction machine to **dispense** digital information.

12 Computer processor
60 Sound system

Alerting Abstract WO A1

NOVELTY - Multiple transaction function devices are provided, each with an associated device computer processor. The processor (12) is operated, when it is operatively connected with one other processor (22) that is associated with secondary transaction device, so that primary device is automatically made interoperative with secondary device, to carry out financial transaction with automated machine.

DESCRIPTION - An INDEPENDENT CLAIM is also included for automated transaction procedure.

USE - For e.g. ATMs like cash, ticket and scrip dispensers, gaming machines and other self service terminals.

ADVANTAGE - Since each service is an individually networked component, it is easily replaced and updated dynamically. Each component of ATM is remotely monitored, taken offline to troubleshoot without interfering with other services in ATM or other ATMs on network.

DESCRIPTION OF DRAWINGS - The figure shows the schematic view of the ATM system.

12,22 Processors

ABSTRACT EP 1030495 A2

An automated banking machine (12) is operative to conduct transactions in response to HTML documents and TCP/IP messages exchanged with a local computer system (14) through an intranet (16), as well as in response to messages exchanged with foreign servers (20, 22, 24, 26, 28,) in a wide area network (18). The banking machine includes a computer having an HTML document handling portion. The HTML document handling portion is operative to communicate through a proxy server, with a home HTTP server in the intranet or the foreign servers in the wide area network. The computer further includes a device application portion which interfaces with the HTML document handling portion and dispatches messages to operate devices in the automated banking machine. The devices include a sheet dispenser mechanism which dispenses currency as well as other transaction devices. The device application portion communicates with a device interfacing software portion in the banking machine through a device server in the intranet. The device server maintains local control over the devices in the banking machine including the sheet dispenser. The banking machine operates to read indicia on the user's card corresponding to a system address. The computer is operative to connect the banking machine to the home or foreign server corresponding to the system address, which connected server operates the banking machine until the completion of transactions by the user.

ABSTRACT EP 961249 A2

An automated banking machine (12) is operative to conduct transactions in response to HTML documents and TCP/IP messages exchanged with a local computer system (14) through an intranet (16), as well as in response to messages exchanged with foreign servers (20, 22, 24, 26, 28,) in a wide area network (18). The banking machine includes a computer having an HTML document handling portion. The HTML document handling portion is operative to communicate through a proxy server, with a home HTTP server in the intranet or the foreign servers in the wide area network. The computer further includes a device application portion which interfaces with the HTML document handling portion and dispatches messages to operate devices in the automated banking machine. The devices include a sheet dispenser mechanism which dispenses currency as well as other transaction devices. The device application portion communicates with a device interfacing software portion in the banking machine through a device server in the intranet. The device server maintains local control over the devices in the banking machine including the sheet dispenser. The banking machine operates to read indicia on the user's card

corresponding to a system address. The computer is operative to connect the banking machine to the home or foreign server corresponding to the system address, which connected server operates the banking machine until the completion of transactions by the user.

Alerting Abstract US B1

NOVELTY - The apparatus has a merchant transaction system with a communication device e.g. ~bluetooth~ device, wirelessly **receive** customer checking account data and electronic customer signature data from a hand-held device (300) e.g. phone. An electronic check template with **software** enables the merchant transaction system to use **received**

checking account data, customer signature data, a purchase amount, and a merchant identifier, to generate a dated electronic check including a customer checking account number, a customer signature, the purchase amount, and the identifier.

DESCRIPTION - An INDEPENDENT CLAIM is also included for a method comprising operating a customer approachable checkout terminal of a merchant **transaction** system to determine a purchase amount during a purchase **transaction**.

USE - **Transaction** apparatus for **conducting** financial **transaction** for purchasing an item i.e. cloth, using credit card such as ****MasterCard****(RTM: Payment card), ****VISA****(RTM: Payment card), ****Discover****(RTM: Credit card) ****American Express****(RTM: Credit card), ****Diner's Club****(RTM: Credit card), in an **automatic teller machine (ATM)** and **automated banking machine**.

ADVANTAGE - The apparatus effectively carries out **transactions** and enables a user to remotely interact with a **transaction terminal device** such as an **automated banking machine**, electronic **cash** register, or electronic funds transfer terminal. The apparatus facilitates to change the character of the indicia on a card such as a stored value card, thus allowing a single card to be used as a substitute for any one of a set of credit and debit cards. The apparatus reduces a number of credit and debit cards carried by a person. The apparatus selectively **displays** visible indicia reproduced from the card or object. The apparatus is compact, portable and lightweight. The apparatus is economical to produce and easy to operate. The apparatus authorizes operation based on a physical characteristic of an authorized user.

DESCRIPTION OF DRAWINGS - The drawing shows a block diagram of a **transaction** payment arrangement for an item purchase.

300 **Hand - held device**

Alerting Abstract US A1

NOVELTY - The system has a portable wireless device e.g. personal digital assistant, mobile phone, including an input device, an **output** device, client applications and a digital certificate. The portable wireless device wirelessly communicates with an **automated teller machine (ATM)** including a **cash dispenser** in order to carry out a financial transaction when an input is provided to the input device.

DESCRIPTION - An INDEPENDENT CLAIM is also included for a method for wirelessly **sending** a message from a portable device to an **automated teller machine (ATM)**.

USE - Used for banking **transaction** e.g. **dispensing** of **cash** , **receipt** of deposits, transfer of funds between accounts, payment of **bills** , cashing checks, **receiving money** orders and account balance inquiries.

ADVANTAGE - The portable wireless device includes **client applications** which are **operative** to facilitate the servicing of the **automated teller machine** remotely by several users for carrying out **transactions** reliably and rapidly. The **ATM** is manufactured at lower cost due to the elimination of parts associated with a **display screen** , keypad, and **function** keys.

DESCRIPTION OF DRAWINGS - The drawing shows a schematic view of a wireless **automatic teller machine (ATM)** system.

Alerting Abstract EP A1

NOVELTY - The information exchange device includes a communications module which wirelessly transmits verification information associated with an authorized user of the information exchange device, to enable verification of whether the user of the device is an authorized user.

DESCRIPTION - The personal financial assistant includes magnetic and smart card reading and writing capability, financial **software** and automatic communications capabilities to **interface** with **automated teller machines (ATMs)** or other Personal Digital Assistants (PDAs). The device also includes a radio frequency transceiver, an infrared data association transceiver, data encryption standard **processor** and flash memory. INDEPENDENT CLAIMS are included for; an information and **transaction processing** system; a method for **performing** an electronic **transaction** with an information and **transaction processing** system.

USE - Universal card system for **transmitting**, **receiving** and displaying information for e-commerce and banking **functions**. For installation as part of a system to serve individuals located in e.g. kiosk, car, aircraft etc.

ADVANTAGE - Allows financial institutions to quickly and effectively tailor information to specific individuals.

DESCRIPTION OF DRAWINGS - The drawing shows a perspective view of one embodiment of the invention.

- 1 User **interface**
- 2 **Display**
- 3 Universal card
- 4 Card reader/writer
- 5 Docking port

Alerting Abstract US A

NOVELTY - RAM (21) accessed by **interface** device (11) of service provider, stores program modules (43) comprising instructions that are not in native code. The **processing** device memory has program interpreter for interpreting and executing the program module, when the microcomputer is under control of operating system, to effect **transactions** based on program module instructions that are not in native code.

DESCRIPTION - The **interface** device is connected through a coupler (14) for effecting communication with the **processing** device having microcomputer. The **operating** system programmed in native **code** of microcomputer provided for the **processing** device memory, is **run** for **performing** basic **functions** of the **processing** device. The microcomputer stores **received** data or data for **transmission** in RAM (21), when **performing** function under **control** of the **operating** system.

INDEPENDENT CLAIMS are also included for the following:

- 1.intelligent device ;
- 2.commercial transaction method

USE - In e.g. Internet for effecting commercial **transactions** between service users and service providers, using **intelligent** devices, terminals acting as satellite to host, e.g. electronic funds transfer point-of-sale (EFTPOS) terminals, internal terminals, smart card terminals, mobile phones, **PDA** , portable home automation and security **controller** , portable **home PABX controller** .

ADVANTAGE - Enables service user to transact with the same or different service providers using intelligent devices with high level of security reliably.

DESCRIPTION OF DRAWINGS - The figure shows the schematic logic diagram of the intelligent device connected to the host.

- 11 **Interface** device
- 14 Coupler
- 21 RAM
- 43 **Program** module

Alerting Abstract WO A1

The customer is equipped with a mobile telephone which makes use of a mobile telephone network (6). The mobile telephone includes a mobile unit (1) and a removable identification module in which a customer identification and an electronic sum of money can be stored. The method involves reloading the sum of money from the service centre via the mobile telephone network using a secure reference.

The customer identification is transmitted to the terminal (2) via a contactless **interface** between the identification module (10) and the terminal. The terminal checks the permission of the customer to carry out a financial **transaction** using authorisation data transmitted via a public telephone network. The amount of the **transaction** is transmitted to the terminal via the contactless **interface**.

USE - E.g at point-of-sale terminal.
ADVANTAGE - Avoid inconvenience of cards.

Alerting Abstract WO Al

NOVELTY - A network communicates the user interactive **devices** to the **transaction** execution system. An application mechanism is coupled to the network for interfacing between the user interactive **devices** and the **transaction** execution system, and coordinating interaction of the user **interface devices** with the **transaction** execution system.

DESCRIPTION - INDEPENDENT CLAIMS are included for; a system for interfacing user interactive **devices** with a **transaction** execution system; a method for executing **transactions** requested by users using user interactive devices; a method for providing a **transaction** execution with the functionality of interacting with user interactive devices; an enterprise system for interfacing between a network and an existing user; a method for distributing scene information between a client and an application server across a network; a method for programming an application for use in an IP network environment.

USE - Providing add-on **transaction** system that **interfaces** network of users with an existing on-line **transaction** execution system.

ADVANTAGE - Does not require significant modifications to the functionality and/or protocol of such **transaction** execution system.

DESCRIPTION OF DRAWINGS - The drawing is a schematic system block diagram illustrating the integration of the **transaction** system of the invention,

with a **transaction** execution system in a network environment.

10 **Transaction** system
12 Network
14 **Transaction** execution system
16 Users

Title Terms/Index Terms/Additional Words: **INTERFACE** ; SYSTEM; USER;

Alerting Abstract WO A1

NOVELTY - Processor has a CPU, memory for financial and personal information and a temporary digital certificate, a communication link, user interface, a detachable universal card, programmer for writing personal and financial information to the universal card and a verification means coupled to the CPU to verify the authorized user and preventing the programmer from writing to the card unless verification data is provided.

USE - **Processor** is for information and **transactions** and uses digital certificate security and biometric authorization to provide personal verification prior to **processing** user requested financial **transactions** and providing personal information at point of sale terminals or **ATMs**.

ADVANTAGE - **Processor** is a personal digital assistant which can store credit card etc. and personal information for transfer to a smart card. It uses biometric security to provide user verification and has digital certificate security with the user required to periodically download a temporary digital certificate from a central server of the card service provider. It is compatible with the existing infrastructure and can be used in all systems using magnetic or smart cards for access.

Alerting Abstract WO A1

The telephone **transaction** entry system includes a data input device including a **display** (14) and a data **transaction terminal** (18) which presents a template to the **display**. The template includes several prompts customised to a particular **transaction** type for eliciting data input into the input device by a user. The **transaction terminal** formats the template and input data from the user into a data **transaction** for **transmission**.

A database server is associated with the database which **receives** the data **transaction**. The server uses the data **transaction** to create, depending on its particular type, at least one additional data **transaction** containing data for a particular record in the database. The server stores the additional data **transaction** in the record.

ADVANTAGE - Permits user to organize and control all aspects of personal **transactions** as well as any **transactions** which occur in office. Since data **transactions** are created without use of operating system or **application programs**, **transaction entry device** is simple and inexpensive and may be readily integrated with customer's desktop telephone or **portable telephone**.

Alerting Abstract WO A1

The electronic wallet (100) has a keyboard (102), **function** keys (104) and buttons (106) for user input of data and commands. A liquid crystal **display** (108), a speaker (110), light **display** (114) and tactile alert indicator provide user **display** and information.

Data may be entered by means of a bar **code** reading optical wand (116) and financial card reader (122). A printer (118) provides hard copy output of cheques and other information. The wallet is capable of selective call **receiving** a wireless message via an aerial and **receiver**, including balance and **performing** financial **transactions**.

USE/ADVANTAGE - Portable financial **transaction** and communication **devices**. Simple and accurate balance checking. Allows concurrent use of same financial card or cheque account.

Equivalent Alerting Abstract US A

The wallet includes memory for storing at least a balance corresponding to an account in a financial institution. A selective call receiver receives a wireless message transmitted from a remote transmitter.

The wireless message includes financial information relating to the balance for conforming a financial transaction with the financial institution. A controller is coupled to the memory and to the receiver, and can update the balance in the memory in response to the wireless message.

ADVANTAGE - Capable of communicating financial information and storing and updating at least one of the financial information and a balance.

Alerting Abstract DE A

The data **transmission** system has the bank card (1) inserted in a read/write device (2) used to enter a PIN number for verification of the card user. The inserted card (1) communicates via a data communication network with a further card or read/write device upon input of the correct on-line **code**, to allow direct banking transactions.

The bank card (1) and the read/write (2) device are coupled to the telephone network via a modem, with a similar modem at the bank end. USE/ADVANTAGE - Also for hotel reservations, bookings etc.. Allows stored **code** to be updated.

...SPECIFICATION method of operation, dispensing takes place by sending a signal to the ATM to authorize **dispensing** of a predetermined quantity of **cash** in response to receipt by the ATM of a verification signal. The verification signal may...

...cash. Preferably and most simply, the verification signal may comprise keypad input of a transaction **code** **directly** at the **ATM**. The transaction **code** may be **sent** to a **mobile telephone** or similar **communication** device belonging to the person desiring to withdraw cash. This person would then submit the verification signal to the **ATM** as an acknowledgement of identity.

The invention also relates to a method of cash transaction...

...a reduced scale safe 10. Destruction device 26 comprises a perforator and ink spray which **operate** to perforate the stock of cash 18 and mark it with indelible ink on receipt of an appropriate signal.

A **wireless communication device** 20, position determining device 22, and microprocessor 24 are also located within interior 14. Although ...

...The microprocessor 24 controls operation of the ATM 1, and contains the necessary software for **performing** its **functions** as will be described below. In particular, it includes a **communication encryption application** for the communication device 20 ensuring that messages **sent** and **received** are sufficiently encrypted to avoid interception. It also

includes a **cash** management **application** to control the **dispensing**
(and **receipt**) of **cash** .

The exterior of the safe 10 is provided with a dispensing slot 30
leading from...

...On setting up the application software 166, the customer provides
details of the number of **mobile telephone** 162 to the communication
exchange 114, which incorporates the data in its database 112. The
mobile telephone 162 also transmits details regarding its SIM card 164
and the International Mobile Equipment Identity (IMEI) of the **mobile**
telephone 162. In an alternative lower security version, the IMEI **code**
may be omitted, allowing easier **application** set up and shorter
transmission times.

In order to initiate a cash withdrawal, the customer accesses the
application software 166...

INTERNATIONAL PATENT CLASS (V7): **G06F-017/60**

...ABSTRACT transaction system that provides enhanced convenience for both customers and financial institutions by utilizing a **mobile telephone** and a computer network. The automated cash transaction system includes: a server which is **connected** to the computer network, and which distributes a transaction processing program for allowing the **mobile telephone** to carry out processing at least for user authentication and **communications** with an automated cash transaction machine; the **mobile telephone** which **receives** the transaction processing **program** from the server via the computer network, stores the **received transaction processing program**, and carries out the **processing** for user authentication and **communications** with the automated **cash transaction machine** in accordance with the **transaction processing program**; and the automated **cash transaction machine** which carries out automated cash **transaction processing** based on data entered through **communications** with the **mobile telephone**.

NOTE:

...SPECIFICATION present invention, there is provided an automated cash transaction system comprising: a server which is **connected** to a computer network, and which distributes a transaction processing program for allowing a **mobile telephone** to carry out processing at least for user authentication and **communications** with an automated cash transaction machine; the **mobile telephone** which **receives** the transaction processing **program** from the server via the computer network, stores the **received transaction processing program**, and carries out the **processing** for user authentication and **communications** with the automated **cash transaction machine** in accordance with the **transaction processing program**; and the automated **cash transaction machine** which carries out automated cash **transaction processing** based on data entered through **communications** with the **mobile telephone**.

According to a second aspect of the present invention, the transaction

processing program is preferably...

...CLAIMS A1

1. An automated cash transaction system comprising:
a server which is **connected** to a computer network, and which distributes a transaction processing program for allowing a **mobile telephone** to carry out processing at least for user authentication and **communications** with an automated cash transaction machine;
said **mobile telephone** which **receives** said transaction processing program from said server via said computer network, stores said **received transaction processing program**, and carries out said **processing** for user authentication and **communications** with said automated **cash transaction machine** in accordance with said **transaction processing program**; and
said automated cash **transaction machine** which carries out automated cash **transaction processing** based on data entered through **communications** with said **mobile telephone**.
2. An automated cash transaction system as claimed in claim 1, wherein said transaction processing...

...SPECIFICATION means, data concerning an electronic negotiable card that is to be issued, and through wireless **communication** installs a **program** for an electronic negotiable card corresponding to the installation number.

As a result, while the printed matter on which the installation number has been **printed** is employed as a distribution medium, the **program** for the electronic negotiable card can be **transmitted** along the distribution route as a gift product.

According to the invention cited in claim...are printed.

During the installation procedures, first, the coating (scratch portion) is removed. Then the **mobile** user terminal is set to the telephone card mode and the **operating** menu of the telephone card mode is displayed by using the **function** switch (F4). When the **menu** is selected, the installation **screen** is displayed. Following this, the installation card number and the installation number are entered, and...

...ticket mode and the operating menu for the ticket mode is displayed by using the **function** switch (F4). When the **menu** is selected, the installation **screen** is displayed. Following this, the installation card number and the installation number are entered and...received ticket transfer offer response 7404 (display the transfer offer response: 7405). Thereafter, via digital **wireless telephone communication**, the mobile user terminal transmits to the mobile user terminal of user B a ticket...

Detailed Description

Claims

Claim

... transceiver that identifies a class of persons (e.g., handicapped) such that when a person **interfaces** with the **transaction processing** system 26, an attendant will be alerted as to any special customer needs. Yet another...

...personal services to the customer. A further embodiment includes a customer transceiver 50 that transmits **automatic teller machine (ATM)** card information to an **ATM**. Once the **ATM** receives the information, the customer is prompted to input his/her PIN and **transaction** information, allowing the **process** to continue as usual. Various active and customer transceivers (48 and 50, respectively) may be...associated with the entered number, and it must be accepted by the merchant. Otherwise, the **process** will terminate without authorizing the **transaction**. After the customer information has been entered, **processing** flows to step 1245 where the CPU 1120 next transmits the stored customer/transmitter ID...communicate with the pay per view system and purchase the movie directly through the television. **Printer** 1320 may be used to **print a receipt** for a customer upon completion of a **transaction**, and **display** 1340 may be used to communicate information to a customer (e.g., when to input...

...An alternate embodiment merchant transceiver includes a merchant transceiver built into or attachable to a **portable device** (e.g., Palm PilotTM, handheld computer, etc.) that enables the capture and transmission of a...

...The merchant transceiver includes a CPU 1300 with sufficient memory 1305 to capture and locally **process a transaction**. The merchant transceiver may or may not have wireless connectivity to the **transaction processing** system 26. Yet a further embodiment includes a merchant transceiver associated with a vending machine...

...the merchant transceiver without departing from the scope of this invention. In a preferred embodiment, **transaction processing** system 26 is owned

and operated by a company separate from the entities that own merchant store 12 and payment processing system 16. In exchange for the service provided by

transaction processing system 26, merchants are charged fees to **process** transceiver-based **transactions**. First, a **transaction** fee is charged for each **transaction processed** through **transaction processing** system 26. In addition, an advertising fee may be charged to cover brand communication. That is, customer transceiver 50 is supplied under a brand name owned by the owner of **transaction processing** system 26. This brand name is widely advertised to entice customers to patronize merchant stores 12 having the ability to **conduct transactions** using customer transceiver 50. Thus, the owner of **transaction processing** system 26 charges an advertising fee to participating merchant stores 12. Alternatively, the **transaction processing** system 26 may permit large corporations owning multiple retail outlets to market customer transceiver 50...

Title: Why contactless? (smart cards)

Author(s): Hedrich-Geoppert, M.

Journal: Elektronik Industrie vol.20, no.4 p.64-6

Publication Date: April 1989 Country of Publication: West Germany

CODEN: EKIDAT ISSN: 0374-3144

Language: German Document Type: Journal Paper (JP)

Treatment: Applications (A); Practical (P)

Abstract: A contactless chip card contains data processing chips powered through an inductive link which also provides for data **transmission**. Both C2 and C4 cards are available from manufacturers such as Philips and Valvo, and **applications** include **mobile telephones** and **electronic banking**. Typical chips and facilities are described and the advantages of the so-called 'smart card' are discussed. (0 Refs)

TFB plans e-banking, staff cuts to keep up

THAILAND: TFB TO SPEND B 70 MN ON E-BANKING

The Nation (XBO) 25 Nov 1999 p.B1

Language: ENGLISH

Thai Farmers Bank will spend B 70 mn on e-banking services and cut its work force. The move is to keep up with global banking trends and to maintain

its customer base. it is optimistic that it will add one mn retail customer in the next 12 months through its new services, up from the 7 mn presently. The main target of the e-banking service will be retail banking customers. In line with the plan, it will close down some of the inefficient branches from its existing 533 to save costs. Eventually, it will cut its work force from 13,000 to 8,000-9,000 with the next five years. In the e-commerce market, it will collaborate with the largest Internet Service Provider, Internet Thailand to offer an online payment facility via www.thai.com, Internet Thailand's shopping mall website and www.centralselective.com, website of the giant Central Department Store chain. The service will be introduced in January 2000. In addition, it will tie up with the second-largest mobile phone operator, Total Access Communication (TAC) to launch an e-mobile phone banking service in February 2000. The service will **send** short messages to the mobile phone users to inform them about their **utility** bill payments. The users will be able to execute the bill payment order from their **handset**. The bank's other e-services comprise of the "TFB e-info Service" - a special service to **send** information like account balance, returned cheques and currency exchange rates to pager and digital mobile phones; the "TFB e-cash Card" - a local debit card with a choice of card designs with which the cardholder can sign for and charge purchases in addition to its use as an **ATM** card and "TFB e-savings Account" - a savings account where passbooks are not necessary for transactions. The bank plans to slowly move its customers to the Internet world by the use of its e- **ATM** -based service to encourage them to use high-tech machine. Initially, its e-banking centres will be based at nine Bangkok Transit System's skytrain station from the inauguration of services on 5 December 1999. The centres will operate from 6 am to midnight.

Top up CashCard on the phone
SINGAPORE: FIRMS TIE UP FOR NEW CELLULAR PHONE
The Straits Times (XBB) 15 Dec 1998 p.28
Language: ENGLISH

MobileOne of Singapore and the Network for Electronic Transfers (Singapore) (Nets) have signed a memorandum of understanding with Gemplus Technologies and Motorola Electronics to jointly develop a new cellular phone that allows users to top up their CashCards. The new **handset**, which will be the first of its kind in Asia, will look just like the Motorola StarTAC 90 and it will be **put** on the market in mid-1999. Motorola and MobileOne will contribute telecommunications infrastructure and **software** to the new service. Gemplus will develop the SIM card **software** and Nets will contribute its expertise in electronic funds transfer services. The cellular phone top-up service will be the first in a range of **electronic**

banking and fund transfer services to be offered by Nets using Singapore's cellular communications networks. Other services to be introduced by Nets include cellular phone banking, bill payment and ticket reservations.

Pay By Touch (TM) Solutions, founded in 2002 and based in San Francisco, California, is a privately held company provides retailers and shoppers with biometric authentication products and services. The firm's systems, deployed at 11,000 retail locations, support payment, marketing, and loyalty **program** processing. SmartShop (TM) provides retail customers with personalized promotional offers. Information is accessed through card- or biometric-based kiosks, or with **cellular devices**, or through e-mail channels. Pay By Touch Solutions' Shopper ID Services captures and manages opt-in customer data. Self-service kiosks are employed in handling enrollment and targeted information **delivery** processing. Pay By Touch Wallet, which employs fingerprint biometric scanning technology, links consumers to their financial accounts, personal information, and membership accounts. The eCheck biometric system debits consumers' checking accounts. Transactions are processed through the Automated Clearing House (ACH) network. Pay By Touch Solutions' Paycheck Secure (TM) is a check cashing system. The TrueMe (TM) service supports biometric online multifactor authentication processing. The firm's **ATM Direct** (TM) division provides merchants with online, PIN-based debit payment services. Pay By Touch Solutions holds 30 patents on its technology. The firm has formed partnerships with IBM, Accenture, Discover Financial Services, VeriFone, NCR, MTX, Agilysys, and other companies. Investors include S&H Solutions, BioPay LLC, CardSystems Solutions Incorporated, Capture Resource, 7th Street **Software** Incorporated, and Convena LLC. Pay By Touch Solutions was formed with the merger of Indivos, formerly Smart Touch, and Solidus Networks.

TITLE: What's in Your (Mobile) Wallet?
AUTHOR: Reedy, Sarah
SOURCE: Telephony, v249 n13 p12(4) Sep 2008
ISSN: 0040-2656
HOME PAGE: <http://www.internettelephony.com>
FILE SEGMENT: Review

Near field communications (NFC), a technology that enables wireless data exchange, is turning the mobile **handset** into a wireless wallet. A viable

platform for banking, it makes possible all basic bank transactions for a mobile phone user. The mobile banking experience seeks to shift consumer behavior away from regular online banking. Consumers will conduct transactions through on- **device clients**, **send money** via the short message service text, or make purchases through NFC. IMS Research forecasts that the number of mobile banking users will increase 66.2 percent over the next four years. Kelly Buday, director of marketing at Firethorn, a prominent provider of mobile banking services, says her company seeks to keep increasing functionality, ultimately leading to mobile payments. For example, Buday thinks **receiving** value-added information prior to disbursing payments will be relevant to the discerning consumer. Similarly, Spencer White, director of mobile financial services for AT&T, says they focus on balance inquiries, transaction history, and bill presentment. Partnering with others, they offer a downloadable Java-based **client** or preloads for the **handsets**. This **client** model allows for offline operation. With the latest information at their disposal, consumers can make the best deals. AT&T has conducted two large consumer trials. White says all NFC experiments in Asia, where consumers experienced RFID technology, were promising. Mobile Money Ventures with Citibank Hong Kong is another team. If all of these pioneering services function efficiently in basic banking and brokerage, then other services like budgeting, sharing, peer to peer mobile payments, and **receipt** capture may be introduced. With greater awareness and availability of NFC enabled **handsets**, only security issues hinder the path to mobile commerce. Using these services, consumers need to encrypt their mobile **handsets** for safety. Automated networks to prevent fraud and having three brands backing a product could override security concerns. The, with the security issues addressed, mobile banking will prove to be a convenience for the consumer.

PRODUCT NAMES: Wells Fargo & Co--Company News (881368); Mobile Banking (821894)

TITLE: Banking On Your Phone to Do Much More Than Make Calls? Now It Can
AUTHOR: Kim, Ryan
SOURCE: San Francisco Chronicle, pD1(2) Jul 29, 2007
HOMEPAGE: <http://www.sfgate.com>
FILE SEGMENT: Review
RECORD TYPE: Product Analysis

Wells Fargo is the latest bank to add mobile service capabilities for its customers. The bank follows other financial institutions like Citibank, Bank of America, Wachovia, and Sun Trust. All of these banks have added similar mobile services within the past several months. Mobile bank services are provided free of charge and allow customers to check their balances, review recent transactions, transfer funds between accounts, and

pay their bills. Many of the services also provide a way to find the nearest bank branch office or **ATM** as well. The move to mobile banking gives consumers greater convenience and adds another function to the ever-evolving cell phone. Mobile banking is a step along the way to transforming the cell phone into an 'e-wallet' that will allow individuals to make payments with it. According to Jim Smith, executive vice president and managing head of Wells Fargo Internet Services Group, there has been a revolution in **mobile devices** in the past four or five years, and customers are more willing to try out new things. Smith believes the devices have developed to a point where customers value advanced features like mobile banking. There are three ways customers can use the services. They can log in to their accounts via the bank's mobile website using the cell phone's browser, **download** an **application** to the phone for quicker viewing and fewer data charges, or do their banking tasks via text messaging on their cell phones.

Obopay, a start-up company based in Redwood City, California, will conduct a pilot **program** that will allow Citi consumers to use their phones in **sending and receiving** money. The **programs** main goal is the remote tracking and management of Citi users mobile payment accounts. Citi users can monitor balances, look at payment histories, add funds completely from **handsets**, and utilize a debit card to access their accounts. The trial will be conducted later part of 2007 at unnamed cities. Citi says it has 200 million customer accounts in over 100 countries. Its brands include Banamex, Primerica, CitiFinancial and Citibank. On the other hand, Sapphire Mobile Systems unveiled a pilot **program** it signed with Elan Financial Services, which oversees transactions for 37,000 **ATMs** across the U.S. Introduced in February 2007, the **program** involves Elan PayCard users to track balances and conduct person-to-person payments via their phones. Both agreements highlight the growing competition in the wireless payment category. Obopay and Sapphire compete with PayPal Mobile, Secure Wireless Transfers, TextPayMe, and Cyphermint. A range of activities involving financial institutions, wireless companies, and retailers that aim to assist consumers in using their phone as a wireless wallet has increased lately. Such activities emphasize the demand for mobile payments by consumers.

A number of major financial services providers, such as banks and credit card companies, are introducing mobile **applications** to allow customers to conduct banking using their cell phones. Citibanks Citi Mobile is a mobile banking **application** that allows users to use their **mobile devices** to view **bank** account balances, pay bills, transfer money, find **ATM** locations, and call customer service. **Customers are required to enroll online and download the application to their mobile phone or smartphone.** Bank of America offers a WAP-enabled web-based mobile banking service that allows customers to check balances, pay bills and transfer funds using mobile browsers. One disadvantage of the service is that WAP shows information without rich graphics. Wachovias web-based **application**, Wachovia Mobile service, is compatible with web browsers used on **smartphones** operated by Microsofts Windows Mobile 5.0, Research in Motions **BlackBerry**, and the Palm OS. In addition, Wachovia has partnered with AT&T to launch in late 2007 **mobile devices** pre-loaded with a mobile **application** to allow Wachovia customers to access a variety of banking services. The mobile banking **application** will be run by Firethorn Holdings **software**. AT&T plans to offer similar preloaded mobile **applications** for BancorpSouth, Regions Financial and SunTrust Banks. Verizon Wireless has also tapped Firethorn to provide a banking and payment **application**, although it has yet to announce any partnership with financial service providers.

Whitelisting defines from the outside the programs that are allowed to execute inside a corporate network and excludes all else. SecureWave's Sanctuary 4 uses whitelisting and is listed in the Windows Embedded for Point Service catalog, which should help SecureWave get traction in the retail and hospitality industries, where Windows Embedded for Point of Service is used to build and run software on a variety of devices, including smartphones and ATMs. While conventional antivirus systems are knowledge-based and require frequent updating and the ability to recognize code as malware, CWIE Holding, an Internet Service Provider (ISP), runs Sanctuary 4. Sanctuary 4 includes applications and device control abilities, which allow CWIE Holding to control which applications run on PCs and servers and also whether or not users can plug in iPods or memory sticks. Another user is the First National Bank of Bosque County in Texas, which also still uses antivirus at the network gateway. Sanctuary operates with automated patching systems such as PatchLink and has a utility that automatically updates the list with patches and upgrades when the user has created a baseline application list. A report by e-mail security vendors Proofpoint and Commtouch Software say, 'No heuristic can block all of the variants,' and in 2006, 'the massive variant viruses turned every hour of an attack into a zero hour.'

RECORD TYPE: Product Analysis

Mobile banking is beginning to live up to its potential as such banks as Bank of America, Citibank, Wachovia, and Wells Fargo add new services. Bank of America now allows customers to check balances, pay bills, and transfer money between their accounts on their mobile devices. Wachovia started offering those capabilities last year, and Citibank's plans include a

mobile banking application that customers can download to their cellphones . Wells Fargo has been testing three disparate approaches to mobile banking and expects to tweak its strategy later in 2007. The services are offered at no extra costs, but cellphone bills can increase, and a dropped connection can lead to worry that a transaction was not completed. The viruses attacking mobile devices , including BlackBerrys , are also a worry, as the viruses increase the risk of doing financial transactions over mobile devices . Some banking activities also are not supported, including such tasks as the opening of new accounts or the addition of new bill payees. Among topics covered are the differences between using web browsers, text-messaging services, and menu-based choices, and users views of the usefulness of mobile banking features.

Financial services are becoming worried about the increasing popularity of wireless access to banks. A growing number of customers are attracted to the idea of mobile access to work through laptops, cell phones or PDAs , but banks are concerned that such devices are not secure enough for sensitive activities that include bank transactions. Mobile devices , unlike the office PC, are more exposed to hackers, theft, viruses, Trojans and insider abuse. Wireless network is also considered to be one of the easiest ways to steal peoples money in the bank. A recent study shows that the use of handheld devices in financial services has increased by over 80 percent in 2006. The primary concern in terms of security involves viruses and attacks as well as the security of data exchanged over wireless or cellular networks. The use of mobile devices creates a problem especially as corporations do not have physical control over the devices. It is a problem for the company to check and update configurations and software . Another problem is the tendency of customers to personalize the use of the handheld devices . Users may download software that could carry viruses and other threats, and since the devices are not always connected to the network, the enterprise has little control. Despite the problems, the use of handhelds is inevitable, and soon, security measures will have to be established. Encryption is seen as a good way of dealing with security issues, although this will likely slow down the transfer of data. Other measures being considered are host-based firewalls, spyware and virus detection and protection, and non-split VPNs to eliminate an open channel linking the business network and the Internet.

ABSTRACT INDICATOR: Abstract

ABSTRACT: Nine papers, most presented at a National Academy of Engineering symposium held in January 1988 in Washington, D.C., focus on the **application** of technology in services businesses at the individual business and industry level. Papers examine service technology and manufacturing as cornerstones of the U.S. economy; **delivering** an automated automotive parts catalog; custodial package tracking at Federal Express; electronic automation at the New York Stock Exchange; the use of technology for competitive advantage--the **automatic teller machine** experience at Citicorp; operations research and the services industries; **cellular mobile telephone** services; modern **bridge** construction and engineering services; and professional services firms and information technology. Contributors are from the fields of business, engineering, and management science. Guile is with the National Academy of Engineering **Program** Office. Quinn is at the Amos Tuck School of Business Administration at Dartmouth College. Index.

GEOWORKS TAKES FIRST STEPS TO PROVIDE SOLUTIONS FOR SMART CARD UTILIZATION ON WIRELESS DEVICES

LENGTH: 825 words

ALAMEDA, CALIF. (Oct. 14) BUSINESS WIRE -Oct. 14, 1997--

Company Brings Expertise of Wireless Devices to Smart Card Forum;

Will Help Create Solutions to Drive Wireless Electronic Commerce

Geoworks (Nasdaq:GWRX), a leading provider of smart phone software solutions, announced today that it will work with the Smart Card Forum to utilize smart card technology on wireless devices, including smart phones.

The Smart Card Forum is a McLean, Virginia-based organization dedicated to accelerating the widespread acceptance of multiple application smart cards. By working with the Smart Card Forum, Geoworks will be able to leverage its extensive smart phone market expertise to help the Forum develop wireless electronic commerce solutions for smart cards.

Smart cards are the size of a typical credit card but are able to store and process information, such as electronic cash, on an integrated microprocessor chip embedded within the card. The card can be inserted into a device which allows users to access the information on the card. Geoworks intends to work with the Smart Card Forum and create new opportunities for wireless handset manufacturers to utilize smart card technology. This will enable their customers to perform a wide variety of electronic banking activities or other financial transactions, such as paying for Web-based transactions or transferring funds from a banking account to the card.

"Smart cards are becoming more and more prevalent and the Smart Card Forum is driving the standards that define smart card technology," said Dr. Paul Chen, technology marketing manager at Geoworks. "Every GSM-based handset already includes a Subscriber Identity Module (SIM) card, which is a smart card dedicated for use in the GSM standard for telecommunications. It makes sense that Geoworks should leverage its expertise in smart phone technology to help the Forum combine smart phone and smart card capabilities. This could create an entirely new paradigm for shopping by turning smart phones into mobile point-of-sale devices."

Smart phone SIM cards include powerful security and encryption capabilities, which can be adapted to enable smart card users to perform secure transaction-based services, such as wireless electronic commerce and secure banking. For example, smart phones could be designed to accept smart cards

through a special slot, enabling a smart phone user to access a bank on the Internet to download electronic cash into the electronic purse application of the smart card -- in effect, making the smart phone a personal, mobile automated teller machine.

Palo Alto-based analyst firm Killen & Associates estimates that telephone companies will see a dramatic increase in electronic cash and Internet transactions, jumping to 25 billion transactions in 2005 from 250 million in 1996. The firm estimates that 30% of these transactions will be made using smart and stored-value cards.

About Geoworks

Based in Alameda, Calif., Geoworks is a leading software provider for the cellular industry and manufacturers of mobile communicating devices, including smart phones. The company has licensed its GEOS operating system to leading manufacturers such as Nokia, Ericsson, NEC, Toshiba Corporation, Hewlett-Packard Company, Brother International Corp. and Canon Business Machines. In addition, the company intends to work with content and services providers and international cellular operators. For additional information on Geoworks and the GEOS operating system, contact Geoworks at 510/814-1660 or on the World Wide Web at <http://www.geoworks.com/>.

In keeping with U.S. law, Geoworks notes that this press release includes forward-looking statements, including the intention to work with the Smart Card Forum to develop applications for smart phones, the potential for wireless device users to perform electronic commerce functions using a wireless device, and the possibility of creating wireless POS terminals that can function as an automated teller machine. Actual results may vary significantly due to various risks and uncertainties, including, but not limited to, the following: i) the risks and uncertainties inherent in the development of complex new technologies; and ii), the smart phone and smart card markets may not emerge to the degree or in the timing anticipated. Additional information is available in the Risk Factors and Business discussions in the Company's Forms 10-K, 10-Q available from the Company or from the Securities and Exchange Commission.

Coming Soon: ATMs in Phones

BYLINE: By George Avalos
LENGTH: 535 words

An East Bay software maker aims to transform wireless phones into mobile automated teller machines that could dispense electronic cash to people on the go.

Alameda-based Geoworks Inc. has begun to brew a batch of new software that would enable digital phones either with or without wires and electronic smart card technologies to work together, the company said Tuesday. The Geoworks technology would let people have access to cash from anywhere, possibly replacing some trips to a conventional ATM.

There is tremendous interest in these kinds of applications," said Michael Killen, principal analyst with Killen & Associates, a Palo Alto-based market researcher.

Electronic cash and Internet transactions are expected to generate 25 billion transactions in 2005, Killen predicts. What's more, according to Killen, smart and stored-value electronic cards will account for a whopping 30 percent, or about 7.5 billion transactions a year. Smart cards typically looks like a credit card but has a computer chip embedded in it.

This could create an entirely new paradigm for shopping by turning smart phones into mobile point-of-sale devices," said Paul Chen, technology marketing manager at Geoworks. The firm makes software that acts as an operating system in wireless phones and hand-held computers.

In one scenario, a person at home or on the move could use a smart phone to access his or her bank account through the Internet. Then, the customer might withdraw some electronic cash, say \$100, and transfer the funds to the memory of the smart card, which could slide into or out of a slot in the phone. The person could then take the smart card, which is really an electronic wallet, to a store to buy goods, using it like a debit card.

Or, people could use the wireless phone to access a merchant that has a storefront in cyberspace and make a purchase directly through the Internet.

You wouldn't use smart cards to purchase a major item such as an automobile," said Bob Bogard, Geoworks spokesman. But for everyday purchases, it will be very convenient."

Geoworks has become a leader in providing software for the new generation of digital wireless phones such as those made by Nokia and Ericsson. The company believes it similarly is ahead of the pack in developing software to meld smart cards and smart phones.

Still, the wireless, software and financial services industry must clear some significant hurdles before they can speed this sort of technology to the mass market.

For one thing, financial companies must create a wireless- and Internet-based system that can handle electronic commerce transactions that use smart cards and transfer money in cyberspace. Plus, there's no assurance the phone and card technologies can be smoothly blended. And the average consumer must become comfortable with the concept.

As a country, we'll never get away from using cash," Bogard said. But there is a real convenience factor that is attached to smart cards. It would be a good system if you can just slide your card in and have the information automatically deducted."
